

10.6 Find Segment Lengths in Circles

Given: picture
 Prove: $AE \cdot EB = CE \cdot DE$

- | S. | R. |
|--|---|
| ① Draw \overline{AC} + \overline{DB} | ① Through any 2 pts there is exactly one line |
| ② $\angle A \cong \angle D$
$\angle C \cong \angle B$ | ② If 2 inscribed \angle s intercept the same arc, then they are \cong |
| ③ $\triangle ACE \sim \triangle DBE$ | ③ AA \sim |
| ④ $\frac{AE}{DE} = \frac{CE}{BE}$ | ④ Corr sides of \sim Δ s are proportional |
| ⑤ $AE \cdot BE = CE \cdot DE$ | ⑤ Cross Multiply |

Theorem 10.14-Segments of Chords

Theorem--If 2 chords intersect in a circle, then the products of the lengths of the segments of the chords are equal.

$$a \cdot b = c \cdot d$$

$$3x = 2 \cdot 12$$

$$x = 8$$

$$x = 2$$

$$4 \cdot 6 = (x+1)(x+6)$$

$$24 = x^2 + 7x + 6$$

$$0 = x^2 + 7x - 18$$

$$(x+9)(x-2)$$

$$x = -9 \quad x = 2$$

$$(8+x)(8-x) = 4 \cdot 9$$

$$64 - x^2 = 36$$

$$x^2 = 28$$

$$x = \pm \sqrt{28}$$

$$\sqrt{x^2} = \sqrt{28}$$

$$y^2 = 8 \cdot 2$$

$$y^2 = 16$$

$$y = \pm 4$$

$$y = 4$$

K Secant segment--is a segment that contains a chord of a circle and has exactly one endpoint outside the circle.

External segment

BC

Tangent segment

DC

Given: picture

Prove: $AExBE = CExDE$

S **R**

① Draw AB & CE **①** Thru any 2 pts there is exactly one line

② $\angle A \cong \angle C$ **②** 2 inscribed \angle s that intercept the same arc are \cong

③ $\angle E \cong \angle E$ **③** Reflexive

④ $\triangle ADE \sim \triangle CBE$ **④** AA

⑤ $\frac{AE}{CE} = \frac{DE}{BE}$ **⑤** Corr sides of \triangle s are prop.

⑥ $AE \cdot BE = CE \cdot DE$ **⑥** Cross Mult.

Theorem 10.15-Segments of Secants

Theorem--If two secants share the same exterior point, then the product of the lengths of one secant segment and its external secant segment is equal to the product of the lengths of the other secant segment and its external secant segment.

$$r \cdot s = t \cdot u$$

$$\begin{aligned} x(x+2) &= 8 \cdot 3 \\ x^2 + 2x &= 24 \\ x^2 + 2x - 24 &= 0 \\ (x+6)(x-4) &= 0 \\ x &= -6 \quad x = 4 \end{aligned}$$

Theorem 10.16-Segments of Secants and Tangents Theorem--

If a tangent segment and a secant segment share an exterior point, then the (length of the tangent segment)² = the product of the lengths of the secant segment and its external secant segment

$$DC^2 = AC \cdot BC$$

$$\begin{aligned} (x+4)^2 &= x(2x+2) \\ x^2 + 8x + 16 &= 2x^2 + 2x \\ 0 &= x^2 - 6x - 16 \\ (x-8)(x+2) &= 0 \\ x &= 8 \quad x = -2 \end{aligned}$$
